

Project Design Phase-II Data Flow Diagram & User Stories

Date	03 October 2026
Team ID	SWTID-2026-2035
Project Name	Implement Client Script & UI Policy (Incident)
Maximum Marks	4 Marks

Data Flow Diagrams:

A Data Flow Diagram (DFD) is a traditional visual representation of the information flows within a system. A neat and clear DFD can depict the right amount of the system requirement graphically. It shows how data enters and leaves the system, what changes the information, and where data is stored.

Project-specific [\(workflow\)](#)

Incident Form Workflow

Agent opens an Incident, enters relevant data, changes relevant fields, Client Script validates client-side behavior, UI Policy applies visibility / mandatory / read-only rules, and incident data is saved.

Result: the Incident form applies the configured client-side behavior before the record is committed.

ServiceNow Incident DFD

Data Flow Diagram - Incident Configuration

ServiceNow Incident form with Client Script and UI Policy controls

Key data flow:

1. User enters or updates incident fields.
2. Client Script validates client-side behavior.
3. UI Policy applies visibility / mandatory / read-only rules.
4. Valid changes are stored in the ServiceNow incident record.

User Stories

Use the below template to list all the user stories for the product.

User Type	Functional Requirement (Epic)	User Story Number	User Story / Task	Acceptance criteria	Priority	Release
ServiceNow Agent	Incident Form Validation	USN-1	As an incident agent, I can enter and update Incident fields with the configured client-side validation.	Configured validation executes on the Incident form and prevents invalid input.	High	Milestone-1
	Client Script	USN-2	As an incident agent, I can receive immediate feedback when an Incident field value does not meet the configured rule.	The client-side rule displays the expected validation behavior without requiring a server round trip.	High	Milestone-1
	UI Policy	USN-3	As an incident agent, I can see Incident fields become visible, mandatory, or read-only according to the configured UI Policy condition.	The relevant field state changes automatically when the condition is met.	High	Milestone-2
	Form Behavior	USN-4	As an incident agent, I can save an Incident after the configured Client Script and UI Policy rules are satisfied.	The Incident saves successfully when all configured conditions are satisfied.	High	Milestone-2
ServiceNow Administrator	Configuration	USN-5	As an administrator, I can configure the Client Script for the Incident form.	The Client Script is active and executes on the intended Incident form event.	High	Milestone-1
	Configuration	USN-6	As an administrator, I can configure the UI Policy and its UI Policy Actions for Incident fields.	The UI Policy applies the intended field behavior when its condition is true.	High	Milestone-2
	Testing	USN-7	As an administrator, I can test the configured Client Script and UI Policy using Incident records.	The expected validation and field-state behavior can be demonstrated and captured as evidence.	Medium	Milestone-2
ServiceNow User	Incident Update	USN-8	As a ServiceNow user, I can update an Incident while the configured form rules remain consistent.	The same configured behavior is applied during Incident updates.	Medium	Milestone-2
Administrator
