

## Project Design Phase Solution Architecture

|               |                                                |
|---------------|------------------------------------------------|
| Date          | 03 October 2026                                |
| Team ID       | SWTID-2026-2035                                |
| Project Name  | Implement Client Script & UI Policy (Incident) |
| Maximum Marks | 4 Marks                                        |

### Solution Architecture:

Solution architecture is a complex process – with many sub-processes – that bridges the gap between business problems and technology solutions. Its goals are to:

- Find the best tech solution to solve existing business problems.
- Describe the structure, characteristics, behavior, and other aspects of the software to project stakeholders.
- Define features, development phases, and solution requirements.
- Provide specifications according to which the solution is defined, managed, and delivered.

### Project Solution Architecture Diagram:

#### ServiceNow Incident - Client Script & UI Policy Architecture

Flow: user interacts with Incident form → UI Policy controls field state → Client Script performs client-side logic → validated data is submitted to the Incident table

Evidence: configured records, test results, and screenshots document the behavior implemented in the ServiceNow developer instance.

Figure 1: ServiceNow Incident architecture and data flow for Client Script & UI Policy.
